                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisonse and Tibozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal urctritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pummorphy in breast feeding infants; and vanereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                Vaccine; eye disease: conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

N.Alternale names: ORF 30156/ORF 17292 composite protein
C.Species: wheat dwarf virus
A.Variely: Swedish isolaine
C.Date: 09-Sep-1987 #sequence_revision 06-Dec-1996 #text_change 21-Aug-1998

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sucsophila melanogaster (Fruit ily).
Sukaryota; Metazoa; Arthropoda; Tracheata; Hexapoda; Insecta;
Sucryota; Meoptera; Endopterygota; Diptera; Brachycera; Muscomorpha;
Subydroidea; Drosophilidae; Drosophila.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
